Dynex 32 inch tv wall mount

1) The first step is to choose the right mounting kit. The kits include hardware for installation on wooden pegs, as well as anchors for installation on concrete, drywall or metal pegs. When buying a mounting bracket, make sure that the one you choose is able to hold the specific size and weight of your TV screen. 2) A typical mounting kit consists of an mounting plate that is fastened to the wall and mounting arms that are fastened on the back of the TV. The first thing to do is to attach the mounting arms to the TV. Most TVs have mounting holes that catch up with the back of the TV. Screw the mounting arms on the back of the TV with the hardware included. Check your owners' manual to help identify the correct mounting hole. 3) Use studs to find the outer edges of wall studs. If the set comes with a paper template, glue it to the wall and use a level to keep it straight. Make sure that the template is centered on the spikes and with a power drill, pierce the mounting holes. 4) Then attach the plate to the wall, screwing in the upper two lag bolts, and then at the bottom. Check that the installation is flat and attached to the wall. 5) Then connect all the necessary wires to the TV before trying to mount it to the wall. There's nothing worse than getting the TV to get on the wall before you turn on the DVD player or cable/satellite and realize you don't have room to grab your hand behind the TV and turn everything on afterwards. 6) Finally, you will want to help lift and direct the TV on the wall plate. Make sure the mounting arms are on the rails securely and lock them in place. Some sets require turning a screw with a screwdriver or turning by hand. Now pop open your drink of your choice, grab a bowl of popcorn and sit down and enjoy the fruits of your labor. Also, see how you can get the best picture of your HDTV. Home House & components parts of House Walls Family HandyMan Install a flat-panel TV yourself and save hundreds of dollars with these easy-to-follow instructions for low profile, tilting and full movement mounted. From the experts of Family Man Magazine You may like: TBDOverviewMounting flat panel on the wall is one of those jobs where a little know-how can save you a lot of money. Professional installation costs anywhere from \$ 150 to \$ 350 - plus the cost of the installation itself. But if you can cope with some precise measurements and drive several screws, you can do first class work yourself for about an hour. Will how to install a TV. Plus, we'll sift through a confusing variety of mountains and help you choose a version that's best for your situation. Dozens of models, three stylesIt is not overloaded by all brands and models. All of them are just variations of three main styles. The three styles differ mainly in how much they allow you to adjust the position of the screen. Settings can remove glare and increase viewing comfort in other ways. But adaptability is most important for picture quality. Like a computer screen, the picture on the TV screen is clearest when viewed directly. So a stand that offers more adaptability gives you a clearer picture in more situations and can even increase your options for where you can put the TV. Most TVs are designed for wall-mounted TV, but make sure yours is before you shop. Look for VESA (Video Electronics Standards Association) in the manual or TV itself, followed by a number like VESA 75. Each stand with the same VESA number will work with your TV. Also consider wiring before choosing a mount. If you plan to run cables inside your walls, the mounting design can determine how and where you can install a socket and cable connections. Then learn how to clean a TV screen. A low-profile lockle stand (\$25 to \$150) holds the TV close to the wall. This creates less of an obstacle on the road of traffic and reduces the risk of damage to the TV or bruises. Mounting hardwarePonitis of these installations is that they do not allow tilting or other settings. So if you plan to hang your TV far above eye level, low screen height is not the best choice. The more expensive installation keeps the TV only 1/2 off the wall – the cheaper models around 1-1/2. Tilting fittingsMore adjustableSettingSettings (\$50 to \$200) allow you to mount the TV above eye level or change the angle to suit the situation - something you might want to do if you watch TV from the floor one day and the sofa the next. Installation hardwareA higher price models are easier to adjust and can be set in any corner. Lower-priced models offer several preset angles and are a little harder to adjust. This is not a problem if you rarely change the angle, but inconvenience if you make frequent adjustments. Full movement of mounted nozzlesThe most versatile optionFill for movement (\$100 to \$500) allow you to tilt, rotating, panoramic and expand the TV. This means that you can pull the TV off the wall and rotate it left or right to face the viewer. Built-in installationFill-motion motion can be mounted on the wall or in a recess box as shown. Mounting hardware The stand arm folds into the box, bringing the TV as close to the wall as the low part of the screen. The box also provides a clean outlet for wiring in the wall. Get the height of the lylow or higher? Three necessary to disperse the TV. When you find the right place, mark one corner with a patch. Set up the TV and add a bar to highlight the bottom and other angles. The most common mistake people make when choosing a TV location is to put it too high. Looking at the screen can give you the back and the cloudy picture (especially if the TV doesn't tilt). Some experts centering of the screen at eye level (when you are seated). Others say that slightly lower is better, so the eye level is centered in the top 2/3 of the TV (this is where most of the action on the screen is). But there's no proper height. Much depends on the size of the TV and room. A large TV in a large room can be mounted higher on the wall, because the viewing angle is reduced when you sit farther away from the TV. So the best way to choose the mounting height is with a trial drive. It's a job for three people – two to hold the TV and the third to judge the height. Just get into the viewing position and look at the screen in different positions on the wall. Once you find the right place, mark the tv's location on the wall with paper tape (photo 1). Then set the TV and add more tape to mark the bottom edge of the TV on the wall. The bar should be an ideal level, so use a level to position it. Also find the centers of wall spikes with the help of electronic spikes (spike centers provide maximum retention power). If you have concrete, brick or block walls, you can control screws anywhere. Check the instructions for anchor recommendations. Position it perfectlyfines-location settingMontocolons on the wall plate of the brackets. Measure from the right edge of the TV to the bracket. Transfer the measurement to the wall. Then find the nearest pedigree and drill. Most wall plates allow you to slide the TV left or right by a few inches so that the plate is not fully centered where the TV will hang. But positioning the plate at the right height can be difficult. Many people end up installing it two or even three times before they get it right. Here's how to avoid wasting time and a wall full of screw holes:First, screw the brackets to the TV, following the instructions. Screw holes at the back of the TV may be hidden by plastic plugs. Just wave them. Then hang the wall plate on the brackets so that the entire stand is attached to the TV. Props on the TV to the wall and measure the distance from the bottom of the TV to the center of each row of mounting holes on the back plate. On the wall, measure the same distances up from the tape and make marks in pedigree places. Check the level marks to make sure they are completely horizontal (horizontal). Then follow the photo. Drill holes in the marks. The holes must be about 1/8 c. smaller than the lag screws. If the manufacturer has not turned on lagging screws, check the instructions and take the recommended size in a hardware store or home center. Then just screw the plate to the wall using a wrench and socket.
